FileChooserDialog — A file chooser dialog

Synopsis

```
use Gnome::Gtk3::Dialog;
use Gnome::Gtk3::FileChooserDialog;
my Gnome::Gtk3::FileChooserDialog $fchoose .= new(:build-id<save-dialog>);
# show the dialog
my Int $response = $fchoose.gtk-dialog-run;
if $response == GTK_RESPONSE_ACCEPT {
# when dialog buttons are pressed hide it again
$fchoose.hide;
```

Methods

[gtk file chooser] dialog new two buttons

```
method gtk_file_chooser_dialog_new_two_buttons (
 Str $title, N-GObject $parent-window, int32 $file-chooser-action,
 Str $first_button_text, int32 $first-button-response,
 Str $secnd-button-text, int32 $secnd-button-response,
 OpaquePointer $stopper
  --> N-GObject
```

Creates a new filechooser dialog widget. It returns a native object which must be stored in another object. Better, shorter and easier is to use .new(....). See info below.

new

```
multi method new ( Str : $title! )
```

Create a filechooser dialog with given title. There will be only two buttons :bt1text and :bt2text. These are by default Cancel and Accept. There response types are given by :bt1response and :bt2response. Defaults for these are GTK_RESPONSE_CANCEL and GTK_RESPONSE_ACCEPT respectively.

The filechooser action is set with :action which has GTK_FILE_CHOOSER_ACTION_OPEN as its default.

The parent window is set by :window and is by default Any.

The values are defined in Gnome::Gtk3::Dialog and GtkFileChooser.

```
multi method new ( :$widget! )
```

Create a filechooser dialog using a native object from elsewhere. See also Gnome::GObject::Object.

```
multi method new ( Str :$build-id! )
```

Create a filechooser dialog using a native object from a builder. See also Gnome::GObject::Object.
